

## 650V SuperGaN® GaN FET in PQFN (source tab)

### Description

The TP65H300G4JSGB 650V, 240mΩ Gallium Nitride (GaN) FET is a normally-off device using Transphorm's Gen IV platform. It combines a state-of-the-art high voltage GaN HEMT with a low voltage silicon MOSFET to offer superior reliability and performance.

The Gen IV SuperGaN® platform uses advanced epi and patented design technologies to simplify manufacturability while improving efficiency over silicon via lower gate charge, output capacitance, crossover loss, and reverse recovery charge.

### Features

- Gen IV technology
- JEDEC-qualified GaN technology
- Dynamic  $R_{DS(on)eff}$  production tested
- Robust design, defined by
  - Wide gate safety margin
  - Transient over-voltage capability
- Very low  $Q_{RR}$
- Reduced crossover loss
- RoHS compliant and Halogen-free packaging

### Benefits

- Achieves increased efficiency in both hard- and soft-switched circuits
  - Increased power density
  - Reduced system size and weight
  - Overall lower system cost
- Easy to drive with commonly-used gate drivers
- GSD pin layout improves high speed design

### Applications

- Consumer
- Power adapters
- Low power SMPS
- Lighting

## Circuit Implementation

**Simplified Half-bridge Schematic**

**Simplified Single Ended Schematic**

Recommended gate drive: (0V, 6V) with  $R_{G(tot)} = 65 \Omega^{(e)}$

For additional driver configurations/options please see application note AN0009.

Recommended gate drive:

Gate drive: (0V, 6V):  $R_{G(ON)} = 50$  to  $150 \Omega$ ;  $R_{G(OFF)} = 0$  to  $10 \Omega$   
 Gate drive\*: (-6V, 6V):  $R_{G(ON)} = 50$  to  $100 \Omega$ ;  $R_{G(OFF)} = 0$  to  $20 \Omega$

\*Drop-in with discrete e-mode gate drive that level shifts any standard silicon MOSFET controller with integrated driver (i.e. NCP1342)

Gate Ferrite Bead (FB)	Required DC Link RC Snubber ( $RC_{DCL}$ ) <sup>(f)</sup>
240 $\Omega$ @ 100MHz	4.7–10nF + 5 $\Omega$

Notes:

- e. For bridge topologies only.  $R_G$  could be much smaller in single ended topologies.
- f.  $RC_{DCL}$  should be placed as close as possible to the drain pin.

## Design Considerations

The fast switching of GaN devices reduces current-voltage crossover losses and enables high frequency operation while simultaneously achieving high efficiency. However, taking full advantage of the fast switching characteristics of GaN switches requires adherence to specific PCB layout guidelines and probing techniques.

Before evaluating Transphorm GaN devices, see application note [Printed Circuit Board Layout and Probing for GaN Power Switches](#). The table below provides some practical rules that should be followed during the evaluation.

### When Evaluating Transphorm GaN Devices:

DO	DO NOT
Minimize circuit inductance by keeping traces short, both in the drive and power loop	Twist the pins of TO-220 or TO-247 to accommodate GDS board layout
Minimize lead length of TO-220 and TO-247 package when mounting to the PCB	Use long traces in drive circuit, long lead length of the devices
Use shortest sense loop for probing; attach the probe and its ground connection directly to the test points	Use differential mode probe or probe ground clip with long wire
See <a href="#">AN0003</a> : Printed Circuit Board Layout and Probing
