1 Purpose

   a. The purpose of this specification is to document the Qualification Report for TP65H150LSG

2. Scope
   a. The products listed in section 1 are fully qualified and released to production.
   b. Qualification test results on these products may reference existing qualification results of similar products per the use of generic data as defined in section 2.2 of AEC-Q101 Rev D1
   c. Each of the referenced part numbers share the same major assembly process and material elements as defined in Stress Test qualification for Automotive Grade Semiconductors, AEC-Q101 and are considered to be part of the same qualification family.
3. Qualification Process
   a. All Fab Lots were processed separately with a discrete amount of time between lots. All lots were assembled using the same Assembly House, on the same assembly line. All lots undergo Final Test using the documented test flow and are screened against documented test limits as appropriate to their part number. All processes and test conditions are documented and maintained under revision control as part of the Transphorm Quality Management System.
   b. Documented process and test conditions that are used for qualification of products are designated “Process of Record”. Changes to the Process of Record are managed through the Process/Product Change Notification Procedure, which is part of the Transphorm Quality Management System.
4. ESD Results: 3 parts pass for each test
   a. Standard Used: ANSI/ESDA/JEDEC JS-002-2018

5. Mechanical Tests

Test Name	**Sample**	**Result**
Wire bond strength	3 lots, 1 unit per lot, all wires	0 Fails **PASS**
Bond Shear	3 lots, 1 unit per lot, all balls	0 Fails **PASS**
Die Shear	3 lots, 2 unit per lot, all die	0 Fails **PASS**

6. Reliability Testing
   a. Failed devices are analyzed for root cause and correction. Only a representative sample needs to be analyzed, though some level of analysis will be applied to every failed part. Acceptable root cause and corrective action and successful demonstration of corrective and preventative actions will constitute successful qualification of a device. The part and/or qualification family can be qualified as long as containment of any problems is demonstrated until corrective and/or preventative actions are in place.

7. Electrical Test Parameters
   a. Components submitted for qualification testing must meet all datasheet parameters before and after stress testing
